City of York Council, University Road

One of PMP Surfacing's most technically complex projects - the new cycle path alongside University Road in York - was a major achievement for the company upon its completion in December 2014. The project required significant civil engineering works, as well as rigorous traffic management of the adjacent road.

In addition to carrying out full groundworks to facilitate the installation of Flexipave, PMP Surfacing also oversaw the installation of new infrastructure, including road signage and bollards.

The result is a project featuring 2,043m² of fully porous Flexipave, creating a permeable pathway for cyclists and pedestrians that requires minimal maintenance.

York's Landmark Cycle Route

At the time, the creation of the new cycle and pedestrian route represented the largest civil engineering project that PMP Surfacing successfully delivered. The major route past the university required careful project management and close liaison with several key stakeholders.

- This project was the company's largest undertaking at the time of completion.
- The route serves as a critical link passing through the university grounds.
- Precision in project management was essential to ensure minimal disruption.

Testimonial

"Flexipave was presented to the City of York Council and met all the criteria set for this product. The council has an ongoing commitment to using recycled products and reducing its overall carbon footprint. The creation of the new cycle path using traditional materials would also have increased reliance on nearby stormwater drains, so a permeable material was required.

Flexipave ticked all the boxes and has met all our expectations since the project was completed. As a council, we aim to identify opportunities to use new and innovative products and in this example it has proved to be of considerable benefit, with the material subsequently being specified for significant projects in the near future".

Shaun Harrison, City of York Council
