Tree Surrounds

Over the past decade, PMP Surfacing has delivered a proven solution for urban tree surrounds. Working in towns and cities across the UK, we have successfully resurfaced hundreds of tree pits using the Flexipave porous surfacing system, helping to enhance streetscapes while protecting vital root systems.

Flexipave is a porous, resin-bound surface that allows water, air and nutrients to permeate directly into the soil below, supporting long-term tree health. Its inherent flexibility enables the surface to accommodate natural root growth and ground movement without cracking or lifting. By partnering closely with local authorities and in-house highways teams, PMP Surfacing ensures durable, low-maintenance and visually consistent results.

Application and Performance

Flexipave has become a preferred solution for local authorities seeking a long-lasting, tree-friendly alternative to traditional materials such as concrete or asphalt. Its permeability reduces surface water build-up, helping to mitigate flooding and improve drainage performance in busy pedestrian areas.

The system can be installed efficiently with minimal disruption, making it ideal for retrofit projects and maintenance programmes. PMP Surfacing works collaboratively with highways teams to ensure each installation meets safety standards, while delivering a clean, professional finish that integrates seamlessly and effectively into the local environment.

Key Benefits of Flexipave Around Trees

- Fully permeable surface allows water, air and nutrients to reach tree roots.
- Flexible structure prevents cracking caused by root growth and ground movement.
- Enhances tree health and longevity in urban environments.
- Reduces surface water and improves drainage performance.
- Low maintenance compared to traditional hard surfaces.
- Durable and long-lasting in high footfall areas.
- Seamless, attractive finish that improves streetscape aesthetics.
- Quick and efficient installation with minimal disruption.
