Commercial Development Surfacing

Gateway 36 is a high-quality mixed-use development providing industrial and logitics facilities adjacent to J36 of the M1. Working with Glencar Construction, PMP Surfacing supplied and installed its flagship Flexipave Surfacing System in a signature Stone Age Bronze finish as part of the wider infrastructure and landscaping works. The project involved logistical challenges including preparation and material transportation, however the team successfully completed the installation within the planned two-week programme.

The durable, sustainable and porous surface has enhanced the public bridleway network, providing a safer and more accessible route for pedestrians, cyclists and horse rider while supporting active travel, sustainable drainage and blending seamlessly within the landscape.

Project Challenge

The existing route required a surfacing solution capable of withstanding regular public use whilst remaining sympathetic to natural environment. The pathway needed to provide excellent drainage, minimise maintenance requirements and create a safe, comfortable surface for a variety of users.

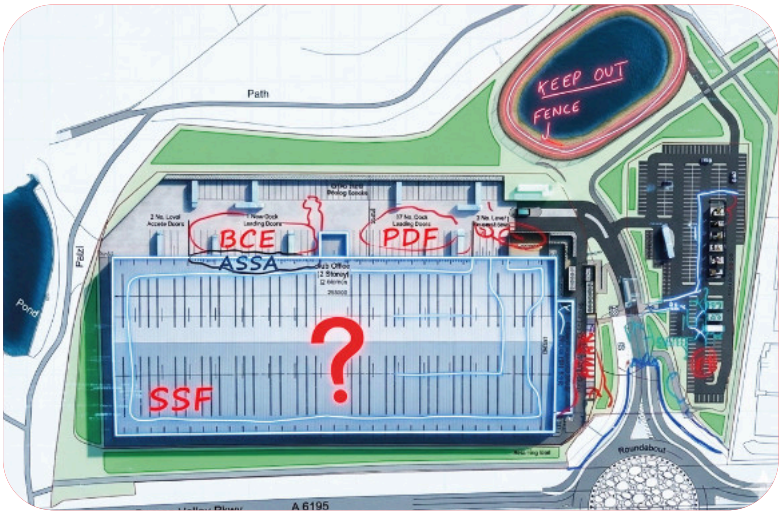

Install Overview

The installation involved preparing the existing route, establishing a stable, free-draining sub-base and carefully laying the Flexipave surface. The experienced team mixed recycled rubber, natural stone aggregate and polyurethane binder on-site, then machine-laid the material to create a seamless, durable and porous pathway.

Visual Impact Provision (VIP) Scheme

The site plan illustrates the extent and positioning of the Flexipave installation at Gateway 36, showcasing the location of the improved bridleway route. The carefully designed pathway enhances accessibility for pedestrians, cyclists and horse riders, providing a durable and sustainable surface that integrates seamlessly with the surrounding environment. The route layout demonstrates how the installation was thoughtfully planned to improve connectivity and encourage active travel.
