Transforming Dunford Bridge

PMP Surfacing and Morgan Sindall joined forces to undertake a project aimed at rejuvenating the Trans Pennine Trail at Dunford Bridge. Through the use of Flexipave, the project encompassed the resurfacing of the trail, car park and surrounding access paths, creating a durable, porous surface designed to withstand regular pedestrian use while blending naturally with the surrounding landscape.

The purpose was to enhance the visual appeal of the location while also prioritising improved drainage and reduced maintenance, aligning with a larger scheme to relocate overhead electrical pylons into underground tunnels within the stunning landscape of the Peak District. The completed installation has provided visitors with a safer, more accessible route that complements the natural environment while delivering long-term performance and sustainability.

Dual Surface Innovation

PMP Surfacing supplied and installed its two signature products, Resin Bound and Flexipave, to deliver a complete surfacing solution. Flexipave is a unique product that offers unrivalled levels of porosity, allowing exceptional water drainage while providing a durable, attractive finish.

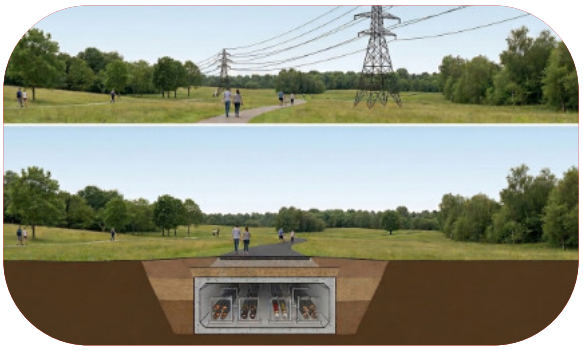

Our Resin Bound system is a highly decorative surface with similar levels of porosity and can be used alongside Flexipave to create seamless vehicular access. Together, these complementary systems provide a practical, sustainable and visually striking solution for a wide range of applications.

Visual Impact Provision (VIP) Scheme

The pylon project was part of the National Grid's Visual Impact Provision (VIP) programme, designed to reduce the visual impact of major electricity infrastructure in protected landscapes.

Involving removing a section of the existing overhead pylons that crossses the Peak District landscape. The overhead cables were replaced with an underground connection, with our Flexipave system laid on top.
