Sustainable Porous Paving Solutions

Set within 82 acres of stunning, sloping parkland, Edinburgh Zoo has been a world-famous attraction for over a century, welcoming visitors from across the globe. Its unique landscape and commitment to conservation make it one of the UK's most distinctive visitor destinations.

In autumn 2021, PMP Surfacing was invited to develop new accessible pathways for an exciting Dinosaur Trail, designed to enhance the visitor experience across challenging terrain.

Following a detailed consultation, phased installations began in early 2022 using our HD1500 and HD2000 Flexipave systems in a Stone Age Bronze finish. The result is a durable, porous, and visually sympathetic pathway network that blends seamlessly with the natural surroundings while ensuring safe, inclusive access for all.

Permeable Flexible Durability

Highly porous in nature, the system allows large volumes of water and air to pass freely through the surface, supporting natural drainage. It can be installed over a range of bases, including standard compacted stone, offering flexibility across different site conditions.

Its dynamic structure provides the ability to gently flex and accommodate minor ground movement without damage. It is also designed to withstand extreme temperature variations without cracking and is available in a wide selection of colour finishes.

Partner Programme

Edinburgh Zoo has joined the PMP Partnership Programme to independently manage its sustainable, porous Flexipave surfacing projects.

Hands-On Training - ground staff completed practical training with PMP surfacing.

Direct Purchasing - the zoo is now authorised to buy raw materials directly from PMP Surfacing.

In-House Capabilities - following the successful installation of the dinosaur Trail, the zoo can now execute its own resurfacing works.
