Sustainable Golf Course Solution

Set within the North London landscape, Muswell Hill Golf Club is an established 18-hole parkland course, offering members and visitors a challenging round in attractive surroundings. As with any well-used golf course, maintaining the wider environment around the playing areas is just as important as caring for greens, fairways and tees. Pathways and access areas need to withstand the demands of regular golf traffic, course operations and changing weather conditions, while remaining in keeping with the character of the club.

With the course continuing to invest in facilities and infrastructure, finding durable solutions that could perform reliably while supporting the club's wider environmental ambitions was an important consideration. This created an opportunity to introduce a modern recycled surfacing solution, providing practical and sustainable improvements to the club's facilities.

Sustainable Surfacing Success

PMP Surfacing installed a durable recycled flexipave surfacing solution across 437m² at Muswell Hill Golf Club. The professionally installed surface provides a hard-wearing, low-maintenance finish designed to cope with regular use while integrating neatly into the golf club environment. The project also delivered significant environmental benefits, with 2,772 waste tyres diverted from disposal and an estimated 60,972kg of CO_2 saved. The installation demonstrates how recycled surfacing can combine performance, longevity and sustainability within a busy sporting environment.

Key Benefits Summary

437m² of new surfacing - a substantial area was transformed with a durable, professionally installed surface designed for long-term performance.

2,772 waste tyres saved - the project gave thousands of waste tyres a valuable second life by incorporating recycled rubber into the surfacing solution.

60,972kg of CO_2 saved - the recycled material helped deliver a significant reduction in carbon emissions compared with conventional surfacing approaches.

Low-maintenance solution - a robust surface can help reduce ongoing maintenance requirements and the need for frequent repairs or replacement.
