Bunker Lining at Aston Wood Golf Club

PMP Surfacing was appointed to provide solutions to ongoing bunker issues at Aston Wood Golf Club.

Following consultation with the golf club, numerous problems were identified including migration of sand and poor drainage. Wind was also displacing dried-out sand, leaving the bunker's wall and other areas exposed.

The image to the right shows the existing bunkers, with a concrete-based liner. The primary issue with this system is the migration of sand from the bunker faces.

To minimise this, our Flexibunker lining offers a forgiving surface that protects the end-users' clubs and assists with the sand adhering to the bunker wall.

- Highly Porous
- Flexible
- Provides Soft Protection
- Durable
- Low Maintenance

Greens Staff Fully Trained

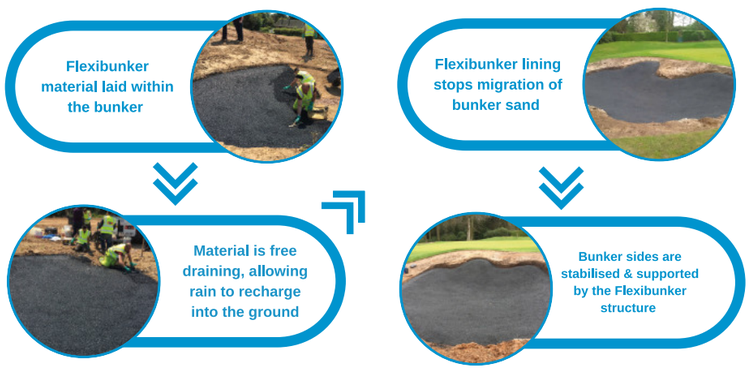

Our team at PMP Surfacing carried out training with the greenkeeping team on how to install our Flexibunker system, this enabled the team to install the system themselves on every bunker throughout the course at their discretion. This service is part of our Golf Partnership Programme.

Specifications

The recycled rubber used in this project repurposed 680 recycled vehicle tyres. These tyres would have released 14,960 kg of CO_2 had they been sent to incineration for concrete manufacture.

The Bunker Lining System

The Flexibunker system provides a durable, self-draining lining within the bunker, allowing natural infiltration. It prevents the migration of sand while stabilising and supporting the bunker sides, ensuring a consistent, long-lasting structure.
