Footpath and Bridleway at Skelton Lake

Skelton Lake Services is located just south of Leeds city centre in West Yorkshire, serving as a key recreational and access area. PMP Surfacing was selected by Leeds City Council to install 1,294m² of Flexipave, working alongside Bethell Civils to construct a new linking pathway and bridleway. The surface needed to support both pedestrians and horses while ensuring durability, safety and environmental sensitivity for mixed-use traffic.

Flexipave was selected following previous surfacing issues, providing a durable, safe and sensitive solution for mixed pedestrian and equestrian use. Its porous structure enables effective drainage, reducing surface water and maintaining a stable, slip-resistant surface in all weather conditions, while offering low maintenance and long-term performance.

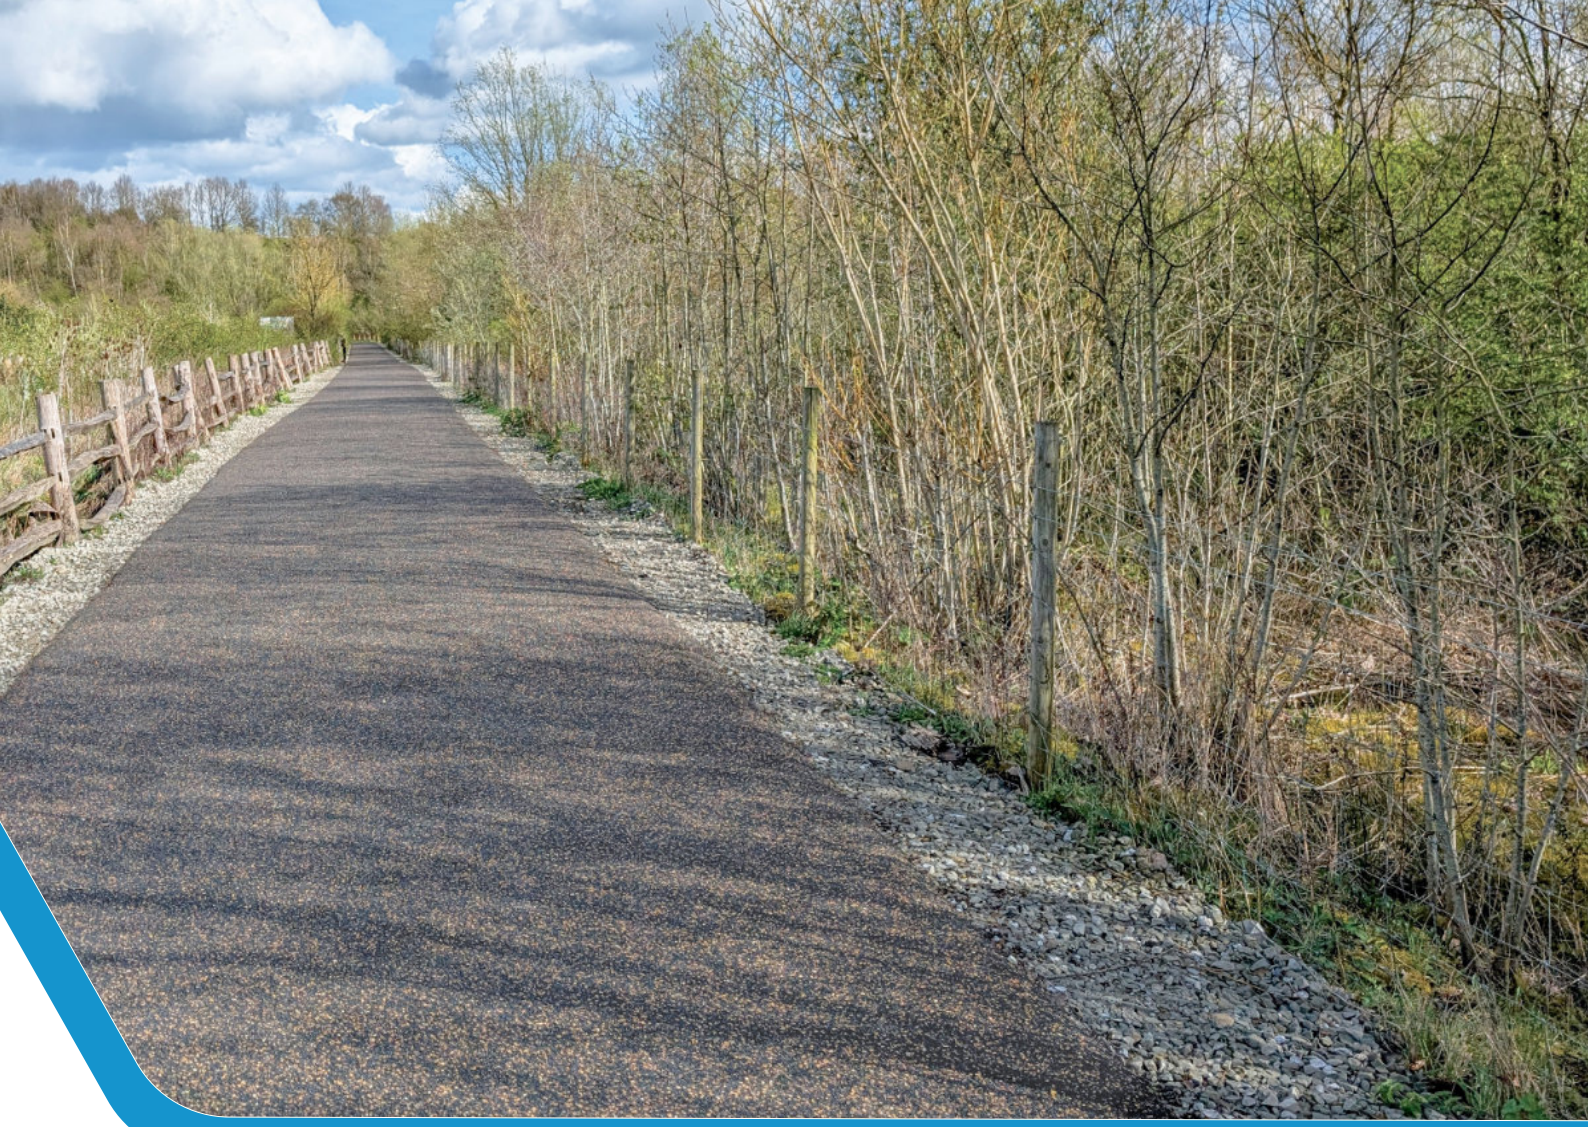

Shared Path Performance

Flexipave was chosen for the pathways and bridleway to provide a durable, porous surface that supports effective drainage, reducing standing water and enhancing safety in all weather conditions. Its permeability ensures SuDS compliance while also supporting root protection in sensitive areas.

The slip-resistant and flexible surface is well-suited to mixed-use routes, accommodating both pedestrians and horses. Careful route design allows for differing movement patterns, ensuring adequate width, stability and comfort. This approach improves accessibility, minimises wear, and delivers a safe, long-lasting solution for shared use.

Key Benefits

Porous Drainage - allows water to pass through the surface, preventing puddles and reducing slip hazards.

Slip Resistance - provides a secure surface for both pedestrians and horses, even in wet conditions.

Durable Build - withstands regular use from mixed traffic without rapid wear or damage.

Flexible Surface - adapts under pressure, improving comfort for horses while maintaining stability for walkers.

Environmental Benefits - manufactured using recycled vehicle tyres and designed for permeability, supporting sustainable drainage and reducing environmental impact.
